

ANSI/TIA 568C Standard

Functional Elements:

In a typical commercial building where ANSI/TIA-568-C.1 applies, Distributor C represents the main cross-connect (MC) or Equipment Room, Distributor B represents the intermediate cross-connect (IC) or Telecommunications Closet, Distributor A represents the horizontal cross-connect (HC) or Horizontal Cabling, and the equipment outlet (EO) represents the telecommunications outlet and connector.

Design Considerations:

The Six Subsystems of a Structured Cabling System

1. Work Area
2. Horizontal cabling
3. Telecommunications Closet
4. Backbone Cabling
5. Equipment Room
6. Building Entrance

1. Work Area (Not considered as being part of Cabling Subsystem 1, 2 or 3)

The work area components extend from the Equipment Outlet (EO) to the station equipment. Work area wiring is designed to be relatively simple to interconnect so that shifting, adding and changing cables is easily managed.

Work Area Components:

- Station Equipment-computers, data terminals, telephones, etc.
- Patch Cables-modular cords, PC adapter cables, fiber jumpers, etc.
- Adapters-baluns, etc. must be external to telecommunications outlet.

2.Horizontal Cabling (Specified Topology:Star)

The horizontal cabling system extends from the work area telecommunications (information) outlet to the telecommunications closet and consists of the following:

- Horizontal cables
- The telecommunications outlet/connector
- Mechanical terminations in the telecommunications closet
- Patch cords or jumpers in the telecommunications closet

Recognized Media:

- 4-pair 100 ohm unshielded twisted pair (UTP)

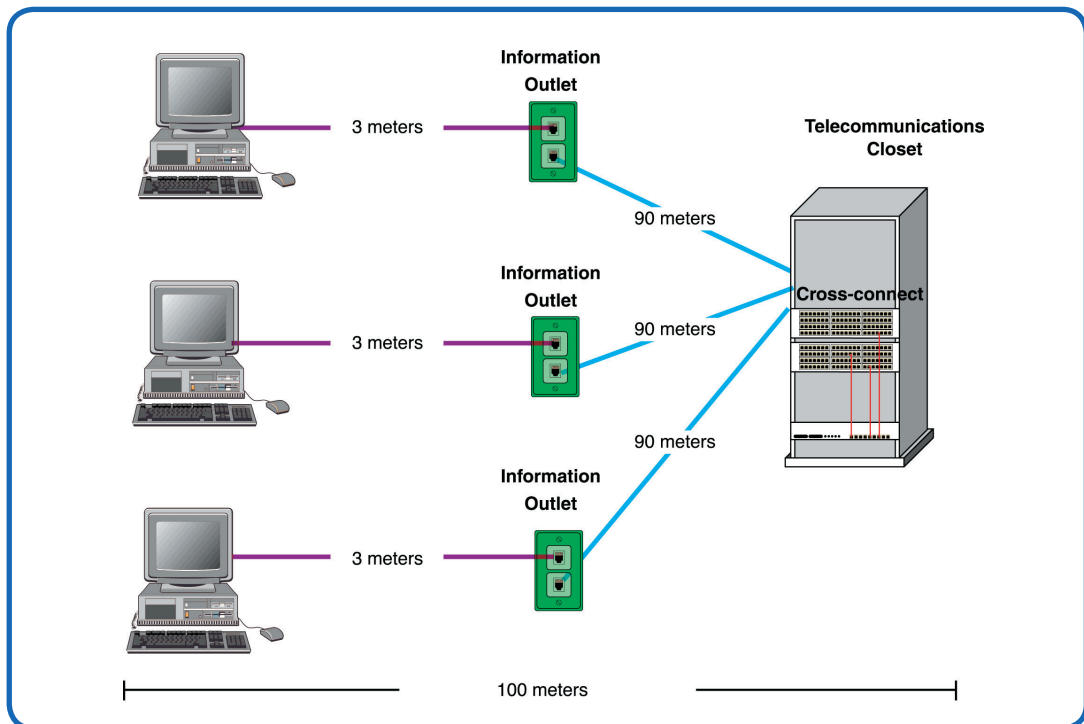

- 2-pair 150 ohm shielded twisted pair (STP-A)

- 2-fiber multimode optical fiber

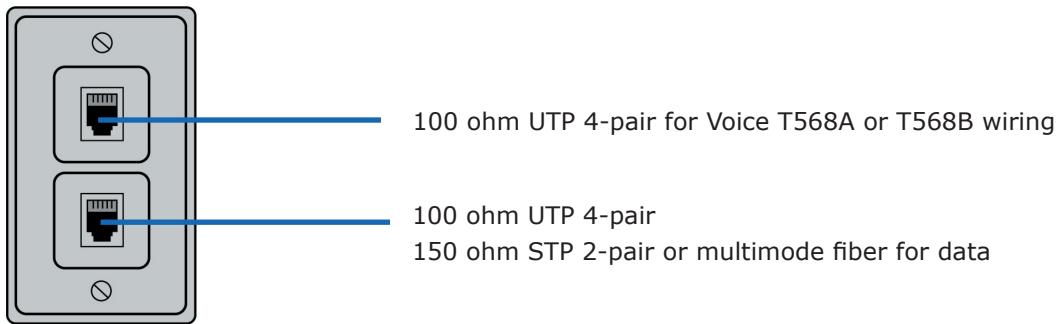

Maximum Distances for Horizontal Cabling:

In addition to the 90 meters of horizontal cable, a total of 10 meters is allowed for work area and telecommunications closet patch and jumper cables.

Telecommunicaton Outlet / Connectors:

A minimum of two telecommunications outlet/connectors are required at each work area.

8-Position Modular Jack Pair Assignments for UTP:

3. Telecommunication Closet

A telecommunication closet is the area within a building that houses the telecommunications cabling system equipment. This includes the mechanical terminations and/or cross-connect for the horizontal and backbone cabling system. Please refer to ANSI/TIA-569-B for the pathway and space design specifications of the telecommunications closet.

Cross-connections:

- Equipment cables that consolidate several ports on a single connector (ie: 25-pair hub) are terminated on dedicated connecting hardware (system specific)
- The dedicated hardware is then connected directly to horizontal or backbone terminations.

4.Backbone Cabling

The backbone cabling provides interconnection between telecommunication closets, equipment rooms and entrance facilities.

Includes:

- Backbone cables
- Mechanical terminations in the intermediate and main cross-connections
- Patch cords or jumpers used for backbone-to-backbone cross-connection
- Mechanical terminations used to terminate backbone cabling in the horizontal cross-connect.
- Cabling between buildings

Recognized Media:

→ 100 ohm unshielded twisted pair (UTP)

→ 150 ohm shielded twisted pair (STP-A)

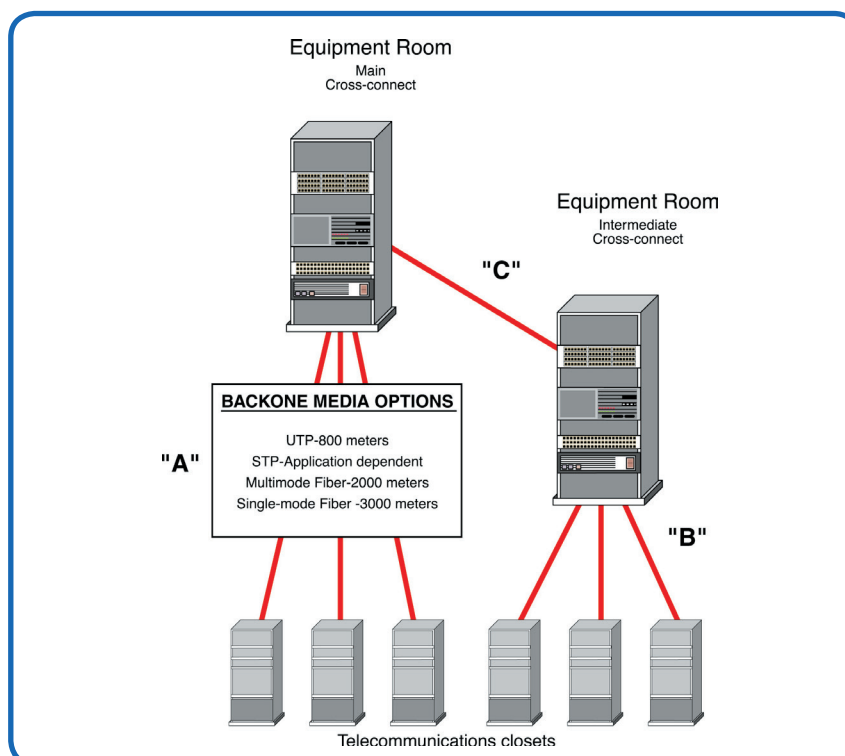

→ multi-mode optical fiber

→ single-mode optical fiber

Backbone Cabling in Star Topology:

Distances:

→ Application dependent:

Cable	"A"	"B"	"C"
62.5/125 um fiber	2,000m(6,560ft)	500m(1,640ft)	1,500m(4,820ft)
50.0/125 um fiber(OM2)	2,000m(6,560ft)	500m(1,640ft)	1,500m(4,820ft)
50.0/125 um fiber(OM3)	2,000m(6,560ft)	500m(1,640ft)	1,500m(4,820ft)
Single-mode fiber	3,000m(9,840ft)	500m(1,640ft)	2,500m(8,200ft)
UTP(voice)	800m(2,624ft)	500m(1,640ft)	300m(984ft)
UTP(data),STP-A	Data applications, limited to 90m(295ft) total		

- Patch cords and cross-connect jumpers at the main cross-connect not to exceed 20m (66ft)
- Patch cords and cross-connect jumpers in the intermediate cross-connect should be 20m(66ft) or less.
- Equipment cables should be 30m (98 ft) or less
- Grounding and bonding must conform to ANSI/TIA-607 as well as applicable authorities or codes.

5.Equipment Room

The design aspects of the equipment room are specified in the ANSI/TIA 569-B standard.

Equipment rooms usually house equipment of higher complexity than telecommunications closet may be provided by an equipment room.

6.Building Entrance

Building entrance facilities provide the point at which outside cabling interfaces with the internal building backbone cabling. The physical requirements of the network interface are defined in the ANSI/TIA-569-B standard. Grounding and bonding must conform to ANSI/TIA-607.

100 Ohm UTP Cabling Systems

The recognized categories of twisted- pair cabling are:

- Category 3: Transmission characteristics are specific up to 16 MHz
- Category 5e: Transmission characteristics are specific up to 100 MHz
- Category 6: Transmission characteristics are specific up to 250 MHz
- Category 6A: Transmission characteristics are specific up to 500 MHz

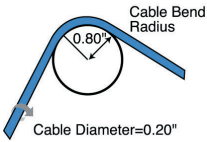

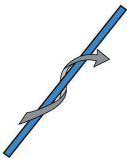

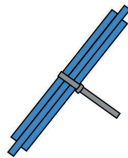

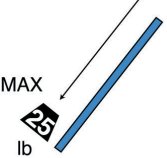

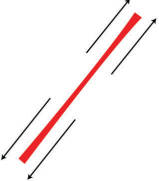

Cable specifications:

- Horizontal: 4 individually twisted pairs
- Backbone: 4-pair or multi-pair
- 24 AWG solid insulated conductors enclosed by jacket exceptions (if requirements are met):
 - Overall foil shield (screened) may be used where required
 - 22 AWG may be used
- Cable diameter must be less than 1/4" (6.35mm) for 4-pair

Patch cords:

- Stranded conductors specified for adequate flexibility.
- Cables must meet horizontal transmission performance requirements (+20% attenuation values allowed)
- Recommended insulated conductor diameter: 0.8mm (0.032 in) to 1mm (0.039 in) Max.=1.2mm (0.047 in)
- Terminated either T568A or T568B pair assignment on both ends

Installation Practices:

<p>Do's</p>					
<p>Don'ts</p>					

Channel Link Category 3, 5e, 6 Verification specifications:

ANSI/TIA-569-B Standard

Commercial Building Standard for telecommunications Pathways and spaces

Telecommunications Closet

- Dedicated to telecommunications function and support facilities only.
- Minimum of one closet per floor
- Additional closets should be provided for each area up to 1000 m² (10,000 ft²) when:
 - The floor area served exceeds 1000m² (10,000 ft²)
 - The horizontal distance exceeds 90m (300 ft)

Recommended Closet Sizing:

(based on 1 work station per 10 m² (100ft²))

Serving Area		Closet Sizing	
(m ²)	(ft ²)	(m ²)	(ft ²)
1,000	10,000	3,000 X 3400	10 X 11
1,000	10,000	3,000 X 3400	10 X 11
1,000	10,000	3,000 X 3400	10 X 11

Equipment Room

- Centralized space for telecommunications equipment
- Shall house only equipment directly related to the telecommunications system and its environmental support systems

Sizing:

- To meet known requirements of specific equipment.
- If equipment is unknown, plan for 0.07m² (0.75ft²) of equipment room space for every 10m² (100 ft²) of work station space.
- Must be a minimum of 14m² (150ft²)
- For special-use buildings, size must be based on number of work stations as follows:

Equipment Room Floor space for Special-use Buildings:

Area

Work Stations	(m ²)	(ft ²)
Up to 100	14	150
101 to 400	37	400
401 to 800	74	800
801 to 1200	111	1200

Entrance Facilities

- Consists of the telecommunications service entrance to the building, including the entrance point through the wall, and continuing to the entrance room or space.
- May contain the backbone pathways that link to other buildings in campus environments.
- Sizing:

Minimum Equipment and Termination Wall space:

Gross Floor Space		Wall Length	
(m ²)	(ft ²)	(m ²)	(ft ²)
500	5000	900	39
1000	10000	990	39
2000	20000	1060	42
4000	40000	1725	68
5000	50000	2295	90
6000	60000	2400	96
8000	80000	3015	120
10000	100000	3630	144

ANSI/TIA-606B Standard

The administration standard for the telecommunications infrastructure of commercial buildings.

Telecommunications Administration Areas:

- Terminations
- Media
- Pathways
- Spaces
- Bonding/grounding

Identifiers:

- Designations assigned to elements of the telecommunications infrastructure.
- Identifiers used to access records of the same type must be unique.
- Encoded identifiers designate the element and provide information about that element.
- Records are the collection of information about or related to a specific element.
- A typical administration system includes labels, drawings, work orders, records & reports.

Additional specifications:

- Identical cables spliced together must be administered as a single cable
- Each horizontal cable must be labeled at both ends
- Termination hardware containing one or more termination positions (e.g.: patch panel jack) may be administered as one termination position.
- A unique identifier must be assigned to each hardware termination unit
- An identifier must be marked on each termination hardware unit or its label
- Station terminations may be labeled on the faceplate, housing or the connector itself.
- Labels can be adhesive, insert or other special purpose labels. Labels must meet legibility, defacement and adhesion requirements specified in UL969 (D16)

Administration Labeling Map:

ANSI/TIA-607 Standard

Commerical building Grounding and Bonding Requirements for Telecommunications

Description:

The standards can be utilized with or without prior knowledge of the telecommunications systems installed in the building. This standard supports a multi-vendor, multi-product environment, as well as the grounding practices for various systems that may be installed on customer premises. ANSI/TIA-607 will be useful to manufacturers of telecommunications equipment, purchasers, installers, or operators of equipment and devices for specifying the exact interface points between the building grounding systems and the telecommunications equipment grounding configuration, and for specifying building grounding configurations need to support this equipment. ANSI/TIA-607 will also help building owners and developers who want to build an advanced technology structure that is compatible with modern telecommunications equipment.

The standard includes specifications for Telecommunications main grounding busbar (TMGB), telecommunications grounding busbar (TGB), bonding conductor for telecommunications, telecommunications bonding backbone (TBB) sizing and bonding.

Telecommunications main grounding busbar (TMGB) refers to a busbar bonded to the service equipment (power) ground by the bonding conductor for telecommunications. The TMGB should be placed in a location that is convenient and accessible.

Telecommunications grounding busbar (TGB) is located in a telecommunications closet or equipment room, it serves as a common central point of connection for telecommunications systems and equipment in the area served by that TC or equipment room.

Telecommunications bonding backbone (TBB) is a copper conductor used to connect the telecommunications main grounding busbar to the telecommunications grounding busbar located on the floor farthest away.
